TITLE: On the Conversion Reactions of Methylolmetacrylamide ( O reaktsiyakh prevrashcheniya metilolmetakrilamida)

PERIODICAL: Zhurnal Obshchey Khimii, 1958, Vol. 28, Nr 5, pp. 1266 - 1269 (USSR)

ABSTRACT: In carrying out one of the experiments for the synthesis of methylolmetacrylamide according to Feuer, Lynch ( Fayer i Linch) (Reference 1) the authors separated, besides this compound, also a product with the melting point  $80.5 - 81.5^{\circ}\text{C}$  which, until now, has not been identified as dimetacrylamido-dimethylether. Many experiments to isolate this product from the mixture of final products of the above synthesis did not succeed, which also was the reason for investigating the conversion reaction of methylolmetacrylamide more in detail. The experiments to realize the dimetacrylamidodimethylether by conversion of the methylolmetacrylamide with benzoylchloride

Card 1/3

On the Conversion Reactions of Methylolmetacrylamide

79-28-5-33/69

in alkaline medium according to Ziegner (Tsigezner) (Reference 3) did not succeed. Being of the opinion that the ether would have to form as a final product in the synthesis of methylenedimacrylamide in the presence of acidous catalysts the behaviour of methylolmetacrylamide in the presence of acidous catalysts was investigated. On heating of the latter with a small amount of hydrochloric acid it could be converted into the dimetacrylamidodimethylether. In the case of increased concentration this ether was converted to the already known methylenedimacrylamide (see reaction scheme). According to the data by Feuer and Lynch, the methylolmetacrylamide polymerizes on heating in the presence of mineral acids and boron chloride ( $\text{B Cl}_3$ ) with formation of unmeltable and insoluble polymers, which fact indicates a three-dimensional structure. The experiments carried out by the authors showed that the methylolmetacrylamide also polymerizes on the action of peroxide stimulaters, in which case polymers of a line or three-dimensional structure can be obtained, depending on the prevailing conditions. In the case of irradiation of this amide with ultraviolet light

Card 2/3

a solid unmeltable polymer results from it. In the masspolymerization in the presence of benzoylperoxide a vitreous polymer forms which is <sup>none</sup>insoluble in water and usual organic solvents. There are 6 references, of which are Soviet.

TITLE: On the Stimulating Effect of Gibberellines of Different Origin (O stimuliruyushchem deystvii gibberellinov razlichnogo proiskhozhdeniya)

PERIODICAL: Doklady Akademii nauk SSSR, 1958, Vol. 121, Nr 4, pp. 755-758 (USSR)

ABSTRACT: In recent years the gibberellines - new physiologically active substances - have drawn the attention of large circles of botanists and plant growers. They have a great influence on growth and development of plants as well as upon their different physiological manifestations and formation processes (Refs 5, 14). Gibberellines are obtained from the secretions of the fungus Fusarium moniliforme (sexual stage is Gibberella fujikuroi on rice). At the moment these substances are produced by special institutes in the USA (S. Sh. A.), England (Angliya) and Japan (Yaponiya). Among the substances produced by them the authors investigated most carefully a preparation obtained

Card 1/4

SOV/20-121-4-50/54

On the Stimulating Effect of Gibberellines of Different Origin

from the fungus Fusarium sp. which was isolated from a befallen vine. The fungus grows well on different culture media both in the case of simple synthetic and composed organic media. Its character and formation are briefly described. It differs from the race which is typical for Fusarium moniliforme. Differences are shown on figure 1. Fusarium sp. produced the active substance on the two following media: 1)  $MgCO_3$  0,3 g, NaCl 0,2,  $KNO_3$  1,0 g,  $FeSO_4$  0,001 g, saccharosis 20 g, tap-water 1 liter. 2) (According to Stodola)  $NH_4Cl$  3,0 g,  $KH_2PO_4$  3,0 g,  $MgSO_4 \cdot 7H_2O$  3,0 g, saccharosis (or glucose) 30 g, tap-water 1 liter. The isolation and purification of the active substance was carried out according to Stodola and others (Ref 13). The preparations Nr 1 and 2 were isolated. Nr 1 was more effective in the case of peas, cucumbers, maize, vetches and others than Nr 2 with respect to acceleration of growth and mass increase. The root system is not activated by any other preparation. The results of the main tests show (Figs 1, 2, Table 1) that the above mentioned preparation Nr 1 does not differ from

Card 2/4

SOV/20-121-4-50/54

On the Stimulating Effect of Gibberellines of Different Origin

gibberelline A<sub>3</sub> (by Professor Lang, Los Angeles) with respect to its effect. It was also impossible to find chromatographical differences. Only the chemical identification will prove whether the preparations Nr 1 and 2 are really gibberellines. There are 3 figures, 1 table, and 15 references, 5 of which are Soviet.

TITLE: Selection of the mean heat load of the surface of a fuel element  
of a water-water vapor reactor under pressure

SOURCE: Inzhenerno-fizicheskii zhurnal, v. 10, no. 5, 1966, 613-619

TOPIC TAGS: reactor fuel element, nuclear reactor, thermodynamic  
analysis

ABSTRACT: The article considers the problem of the choice of the maximum permissible mean heat load for the surface of a fuel element in a water-water vapor reactor under pressure, with cosinusoidal evolution of heat over its height and subcooling at the outlet of the channel  $> 10^{\circ}\text{C}$ . At the present time, to make sure that the heat load at any point over the height of the fuel element does not exceed the corresponding critical heat flux, the maximum heat load is generally taken lower than the minimum critical heat flux. The article shows by mathematical analysis that, in addition to the necessary reserve coefficient, there is a latent reserve which leads to a decrease in the

Card 1/2

L 46574-66

ACC NR: AP6014989

6  
calculated mean heat load of the surface of the fuel element and, consequently, to an increase in the dimensions of the reactor. To eliminate this latent reserve, it is necessary to determine the heat load at that point on the height of the fuel element at which the reserve coefficient is at a minimum. In this case, we get the maximum possible mean heat load and, consequently, minimum dimensions for the reactor. After an extended mathematical development, the article presents a formula which, it is claimed, allows an increase of approximately 30% in the calculated mean heat load of the surface of the fuel element. Orig. art. has: 23 formulas and 2 figures.

AUTHOR: Kirsanov, I. P.

TITLE: Conference of the Specialists for Refractories of the Moscow Oblast (Konferentsiya ogneporshchikov moskovskoy oblasti)

PERIODICAL: Ogneupory, 1958, Nr 7, pp. 332 - 334 (USSR)

ABSTRACT: From May 12 - 13, 1958, an administrative and technical conference took place at the Snigirevskiy Works for Refractories. It had been called by the administration of the metallurgical industry as well as by the technical administration of the Oblast Council of National Economy, and it dealt with the exchange of opinions on mechanization in the works for refractories of the Moscow oblast. The conference was attended by outstanding members from the staff of enterprises, engineers, technicians, commercial managers of the works for refractories in the Moscow Oblast as well as by representatives of the works of refractories in the Sverdlovsk, Stalinc, Zaporozh'ye, Novgorod, and Tula oblasts of the scientific research-and planning institutes. 15 reports and communications were heard. The Chief Engineer of the metallurgical administration of the Council of National Economy of Moscow Oblast S.M.Yegorov, opened the conference with a survey of the achievements of the works in the Moscow oblast. He stressed

Card 1/3

Conference of the Specialists for Refractories of SOV/131-58-7-12/14  
the Moscow Oblast

the low technical level of these works. Other reports were delivered by:

- 1) V.I. Sokolov and I.G. Ul'fskiy on the mechanization plans, on the automation of production processes, as well as on the modernization of the Leningrad Institute for Refractories.
- 2) K.A. Krasotin, D.S. Rutman and I.A. Suvorov on the modernization and mechanization of the Podol'sk works by its laborers and staff.
- 3) L.V. Vinogradova on highly-refractory products.
- 4) D.N. Poluboyarinov, Professor, Doctor of Technical Sciences, on the oxides of various metals used for the production of refractories.
- 5) M.I. Gurova and M.I. Krivoy on the introduction of new refractories in the Snigirevskiy works.
- 6) M.A. Rabinovich on measures taken for improving the work of the heating aggregates at the Snigirevskiy works.
- 7) T.A. Reyngard on improvements in the Vnukovo works.
- 8) M.F. Shcheglova on rationalization work in the Domodedovo works.
- 9) Z.Ye. Dobrin on experiments at the Borovichi kombinat for refractories.

Card 2/3

Conference of the Specialists for Refractories of the Moscow Oblast SOV/ 131-58-7-12/14

- 10) M.P. Dovnar on the dust removal in the Stalinogorsk works.
  - 11) S.D. Skorokhod on demands set up by the metallurgists of the "Elektrostal' " works concerning refractories.
- The participants approved of the measures outlined by the Moscow Oblast Council of National Economy to be taken for a further perfection and an increase of the production of the works in the area. It was recommended to intensify research work.

TITLE: News in Brief (Kratkiye soobshcheniya).  
Production of Ultralight Refractory Products  
(Proizvodstvo ultralegkovesnykh ogneporov)

PERIODICAL: Ogneupory, 1958, 7602, Nr 6, pp. 284-285 (USSR)

ABSTRACT: In March 1958 a meeting took place at the Snigirevo Works for Refractory Products which had been called by the Department for Refractory Products of the Scientific-Technical Society for Metallurgy, and which was devoted to the problem of the mechanization of the production of ultralight refractory products. More than 60 persons took part in the meeting: representatives of the works for refractory materials, of the Leningrad Institute for Refractory Materials, as well as of other organizations. The following reports were heard:

- 1) Ye. A. Fedorova on the technology of the production of ultralight refractory products.
- 2) I. G. Ul'fskiy on machines for molding and grinding light refractory materials.

Card 1/3

News in Brief.

131. 58.6-11/14

Production of Ultralight Refractory Products

- 3) P. S. Potemkin on the drying and burning of refractory light products.
- 4) M. A. Rabinovich on the experience in the production of refractory light materials at the Snigirevo works.

The isolation properties of these products are 2 - 3 times better than those of the other light refractory products. Experiments at the Leningrad Institute for Refractory Products carried out with ultralight refractory products (weight by volume 0.3 - 0.4 g/cm<sup>2</sup>) showed that the heat losses decreased by 47 %, the heating period of the kiln by 26 %, and the output per hour increased per 19 %. The production of these products as well as of the usual foamy ones is based on the foaming of water suspensions of clay and chamotte. The mass of the ultralight products contains 80 % of clay and 20 % of chamotte, whereas the mass of the usual light products contains 10 % of clay and 90 % of chamotte. The drying of the ultralight products requires a mild regime and lasts 5 - 6 days. The shrinkage exceeds 15 % which easily causes cracks.

Card 2/3

News in Brief.

131-58-6-11/'4

Production of Ultralight Refractory Products

The burning of ultralight products takes place together with other products in annular kilns. The meeting decided upon recommendations for the mechanization of the molding process and the perfection of drying and burning. A further development of this production was recommended.

The reasons for rapid hardening of thiolol. A. Tkáč, V. Kello, and L. Ulický (Slovenská vysoká škola tech., Bratislava, Czech.). *Chem. zvesti* 12, 391-400 (1958) (German summary). By studying the factors causing a rapid hardening of thiolol (I) of domestic origin (Czech.), it was detd. that the loss of plasticity and elasticity is caused by polymer crystn. The decompn. products of  $\text{Na}_2\text{S}_2$  formed by thermal reaction or by spontaneous oxidation of S linked to  $\text{Na}_2\text{S}_2$  accelerate the process of crystn. By prep. I from  $\text{Na}_2\text{S}_2$  soln. of definitive concn., a product resistant to rapid hardening is formed which by infrared absorption spectral analyses has shown to be different in the amt. of bound  $\text{H}_2\text{O}$ , decompn. products, and oxidation impurities from a rapid hardening tech. pure product. The structural analyses indicate the presence of cyclic bound S which is in agreement with the results of x-ray structural analyses.

TITLE: Certain methods of dynamic optimization

SOURCE: Strojnický časopis, no. 1, 1966, 107-120

TOPIC TAGS: dynamic programming, computer, dynamic optimization

ABSTRACT: Two methods of dynamic optimization, namely, the method of the dynamic programming and the maximum principle have been compared for advantages and disadvantages and for applicability to the volume of computer computations. The comparison is subject to the assumption that there is only one control system and uniform demand for the speed of the controlled process, that is, the same optimality criterion in both methods of dynamic optimization. The paper was presented by S. Petras, Docent, Engineer, Candidate of Sciences. Orig. art. has: 4 figures and 59 formulas. [Based on authors' abstract] [NT]

AUTHORS: Ulin, O. V. and Tsapenko, M. P.

TITLE: On methods of automatic determination of extremal values of continuous functions

SOURCE: Akademiya nauk SSSR. Sibirskoye otdeleniye. Institut avtomatiki i elektrometrii. Avtomaticheskii kontrol' i elektricheskoye izmereniya. no. 1, 1960, 61-68

TEXT: Methods are considered for automatic determination of the extremal values of non-periodic processes by electronic computers. A function of type  $n = f(t)$  is considered, whose graph is given;  $n$  is the ordinate of the curve and  $t$  - the time. The possible use of electric differentiation of this function is considered. In this case the function  $n = f(t)$  can be represented by the voltage  $U = k_0 n$ , proportional to the ordinate at each moment of time. The derivative of the function can be found by a differentiating RC-circuit. This method, however, poses serious difficulties. Another

On methods of automatic ...

method involves fixing the sign change of the increment of the function. Thereby, the continuous function is transformed into a quantized signal and all subsequent operations are carried out with discrete quantities. Below, several schemes of automatic devices are considered, based on the above method of finding and fixing extremal values. First, a relay servomechanism is considered. The function  $n = f(t)$  can be represented as a pulse which is commuted in different channels. Each channel corresponds to a certain level of the continuous function. The signal arrives at the inputs of the device in the form of discrete values which express the number of the commuting channel. The operation of such a scheme involves several relays. The scheme is fairly simple; its operation does not depend on the frequency range of the process under investigation. In principle, it should yield any required degree of accuracy of decoding; in practice, however, the device is too cumbersome for high-accuracy requirements. Another scheme is the comparator scheme. Its operation involves the comparison of the input voltage with the voltage on a capacitor. Thereby, a current flows through the cir-

On methods of automatic ...

cuit and closes a contact; this fixes the moment of passage through the extremum. This principle can be incorporated in fast electronic computers. As an example, a device is considered where a step input is applied to the comparator cell. This device is stable in operation up to frequencies of 50000 - 100000 cycles. The advantages of the comparator scheme are: The amplitude of the signal is entirely independent of the curvature of the wave-fronts and of the frequency of the process; it cannot be smaller than the known potential difference between 2 neighboring discrete levels. Automatic devices based on the comparator scheme are simple and handy in operation. Their speed is only determined by the rate of switching of the trigger circuit, and can attain 0.5 - 1 million comparison-operations per second. There are 5 figures and 4 Soviet-bloc references.

Card 3/3

function  $R_{\mu}$  from this approximate formula:

$$R_{\mu} \approx \frac{1}{N-\mu} \sum_{v=1}^{N-\mu} x_v x_{v+\mu} - \left( \frac{1}{N} \sum_{v=1}^N x_v \right)^2$$

and permits an automatic evaluation of  $(N-\mu) R_{\mu}$  and NM, of the function  $x(t)$  defined as a table of the numbers  $X_1, X_2, \dots, X_1, \dots, X_n$ . The correlator model was built with ferrite-transistor elements and is rated as "simple, small-sized and reliable." The correlation error is claimed to be 5% or less. The average time of one reading is 0.1 sec. The device is considered sufficient for manual-input operation. Orig. art. has 4 figures, 3 formulas and 1 table.

ULINA, G. V.

Mašnevic, I. Ya.; and Ulina, G. V. On regions of values of analytic functions represented by a Stieltjes integral. Vestnik Leningrad Univ 10 (1955), no. 11, 31-42. (Russian)

Let  $E = E[G(\zeta, t), a, b]$  denote the class of functions  $f(\zeta)$ , regular in  $|\zeta| < 1$ , with the Stieltjes representation

$$f(\zeta) = \int_a^b G(\zeta, t) d\mu(t), \quad \int_a^b d\mu(t) = 1, \quad \mu(t) \uparrow,$$

where the kernel  $G(\zeta, t)$  is a fixed function regular in  $\zeta$  for  $|\zeta| < 1$  and continuous in  $t$  for  $a \leq t \leq b$ . Various choices of  $G(\zeta, t)$  lead to classical normalized sets of functions, thus: (1)  $(e^t + \zeta)/(e^t - \zeta)$  gives the set of functions with positive real part; (2)  $\zeta/(1 - 2t\zeta + \zeta^2)$  gives the set of functions typically real and regular  $|\zeta| < 1$ ; (3)  $-(1 - \zeta^2)/\zeta(1 - 2t\zeta + \zeta^2)$  gives the set of functions typically real in  $|\zeta| < 1$  and regular except for a single pole at  $\zeta = 0$ ; and (4)  $\log(1 - e^{-t}\zeta)$  gives the set of functions  $\log(\zeta/f(\zeta))$ , where  $f(\zeta)$  is starlike and univalent in  $|\zeta| < 1$ .

The authors prove that for fixed  $z$  and  $G(\zeta, t)$ , the domain of variability of  $f(z)$ , for  $f(\zeta) \in E$  is the smallest convex cover of the curve  $G(z, t)$ ,  $a \leq t \leq b$ . From this central theorem they easily deduce a variety of known results and a few new ones.

SUBJECT USSR/MATHEMATICS/Theory of functions CARD 1/2 PG - 541  
 AUTHOR ASNEVIC I.Ja, ULINA G.V.  
 TITLE On the range of values of analytic functions which can be  
 represented as Stieltjes integral.  
 PERIODICAL Vestnik Leningradsk. Univ. 10, No.11, 31-45 (1955)  
 reviewed 1/1957

The authors consider the class  $E = E[G(z,t), a, b]$  of functions  $f(z)$ , being regular in  $|z| < 1$ , having an integral representation of the form

$$f(z) = \int_a^b G(z,t) d\mu(t),$$

where  $G(z,t)$  is regular in  $|z| < 1$  for  $a \leq t \leq b$ , and where  $\mu(t)$  is a monotone non-decreasing function such that  $\int_a^b d\mu(t) = 1$ . Various choices of the

kernel  $G(z,t)$  give well-known classes, e.g.  $E_1 = E\left[\frac{e^{it}+z}{e^{it}-z}, -\pi, \pi\right]$  is the

class of functions having a positive real part in  $|z| < 1$ . It is shown first that the range of values of  $f(z) \in E$  is a closed, connected, convex set which

Vestnik ~~Leningradsk.~~ Univ. 10, No.11, 31-45 (1955) CARD 2/2 PG - 541

is the convex hull of the curve  $w = G(z, t)$ ,  $a \leq t \leq b$ . This appears to be the only theorem proved for the class E, for the authors confine themselves in the sequel to special kernels and deduce only those well-known properties of the corresponding classes; only those properties are deduced which follow immediately from a knowledge of the special kernels.

TEXT:

Let  $S$  be the class of functions  $f(z) = z + c_2 z^2 + \dots$   
... , which are regular and schlicht in  $|z| < 1$ ;  $S^2(c_2)$  - class  
of functions  $f(z) \in S$  with a given coefficient  $c_2$ .

Let  $B$  and  $B^*$  be two arbitrary simply connected domains of the  
 $w$ -plane without common points,  $B$  is assumed to contain  $w = 0$  and  $B^*$   
to contain  $w = \infty$ . Let  $w = f(z)$ ,  $f(0) = 0$  be a regular and schlicht  
function in  $|z| < 1$  mapping  $|z| > 1$  onto  $B^*$ . The set of the pairs  
of functions  $(f(z), F(\mathcal{G}))$ , where  $f(z)$  and  $F(\mathcal{G})$  have the above  
properties, is called the class  $M$ .

With the aid of the variational method of G. M. Goluzin the author  
determines the range of values of the systems: 1.)  $(f(r), c_2)$ ,  
where  $f(\mathcal{G}) \in S(c_2)$  and has real coefficients, with a fixed  $r, 0 < r < 1$ .

C 111/ C 333

2.)  $(\ln \frac{f(z)}{z}, \ln f'(z))$  in the class S for a fixed  $z$  from  $|z| < 1$ .

3.)  $(\left| \frac{f''(0)}{f'(0)} \right|, \frac{f'(0)}{F'(\infty)})$  in the class M.

The knowledge of the boundaries of domains, given by differential equations or explicitly, renders possible an estimation of several related functionals.

The author mentions N. A. Lebedev and A. D. Aleksandrov.

There is 1 figure, 6 Soviet-bloc and 2 non-Soviet-bloc references. The two references to English-language publications read as follows: J. A. Jenkins. On a problem of Gronwall. Ann. math., vol.59, No. 3, 490-504, 1954; T. H. Gronwall. On the distortion in conformal mapping when the second coefficient in the mapping function has an assigned value. Proc. Nat. Acad. of Sciences of America, 6, 300-302, 1902.
